

INSTRUCTIONS TO THE CANDIDATES

- ❖ Do not use sketch pens/ high –lighter pens/ color pencils etc., in underlining / highlighting certain points in the answer or while drawing sketches etc.,
- ❖ Check the Answer booklet thoroughly. The defective answer booklet may be returned to the invigilator before starting the examination.
- ❖ Ensure that the OMR Barcode sheet is properly secured to the answer booklet.
- ❖ Do not write on or tamper the Barcode. If you do so, your booklet will not be evaluated.
- ❖ The candidate is prohibited from writing his/ her NAME / ADDRESS/ PHONE NUMBER / EMAIL ID / Religion or any other matter on any part of the answer booklet / drawing sheet/ graph sheet/ addressing the examiner in any manner whatsoever in the answer booklet. The candidate is not supposed to tear a page in full or part of the booklet.
Non-adherence with this instruction shall result in candidate being booked under malpractice.
- ❖ Answer should be written on both sides of the paper. Candidate should write in all 25 lines in each page. It is not necessary to begin each answer in a fresh page.
- ❖ Candidate should write only question number in the margin.
- ❖ Candidate should return the answer booklet to the invigilator before leaving the examination hall.
- ❖ **ADDITIONAL SUPPLEMENT OF ANSWER SHEETS WILL NOT BE ISSUED.**

INSTRUCTIONS TO THE EXAMINERS

- ❖ Invigilators should ensure that the above instructions are strictly followed by the candidates.
- ❖ After verifying the particulars on the OMR sheet, invigilator should sign in the box specified.
- ❖ Do not crumple or cut the sides of the sheets.
- ❖ Do not write, mark or damage the timing tracks or Barcode.

5

A

SDLC.

The roles of Alpha and Beta testing in software development Life cycle is important. They help to find the bugs and find the loopholes within the development.

Alpha testing is given the product in its alpha version. This version probably has the most bugs and errors. The Alpha tester proceeds to use this product and give his feedback to the development team. They take that in put and try to fix a few bugs. This process is repeated.

The Beta tester is given the product in its alpha Beta stage. The version is nearly ok but not good enough for it to be deployed and delivered to the client. This can also be called as Cleanup or bugs stage. These bugs are reported to the development team and they polish the product before its delivered.

They contribute to improving software quality and reliability as they make sure the product is ~~not~~ in its best shape before deployment. Even after deployment there are tests which ensure the product is stable.

B

EVM (Electronic Voting Machine)

Testing plan.

- First we need to gather the requirements for testing.
- We need to run our tests and get outputs.
- Analyse the outputs and find the bugs.
- Isolate the bugs and keep note of them.
- Try to replicate the bug and try to find the cause behind it.

• After then try to fix the bugs.

• Re-test the application to see if the unit bug exists.

• Now test with the whole application to see if the bug is removed completely.

1.

A

Waterfall.

• In the waterfall process it is 5 steps.

- Requirement gathering
- Design
- Code
- Testing
- Deployment.

After a step is done and moved forward we cannot move back.

agile

under agile we are Scrum and Kanban.
Both of which help in planning and organising the Development process

E

White box	Black Box
• Also called transparent Box	• Also called Dark box
• Tester has full access to code	• Tester doesn't need code to test.
• Highly skilled tester required	• moderate skilled testers are enough for the job
• Extremely time/cost consuming	• moderately time/cost consuming

E

Software Size estimation:

There are quite a few factors of which the software size matters.

- Client's requirements & components.
- ~~Budget~~ Budget
- Time ~~and~~ deadline
- Work force

• With consideration of these the software size will be estimated

C

Layered pattern

- The pattern is in layer form
- It is most widely used pattern
- It is best for real-time applications like food delivery where process is a layer
- Advantage with layered is we can backtrack to mistakes

2

C

Risk identification

- Gather requirements / information.
- Running Test.
- Gather analysis output
- Analyse output
- Key out risks.
- Find necessary ~~plan~~ precautions.
- Implement precautions
- Fix risks.

4

A

Architectural pattern is used to design ~~prototypes~~ ^{project} as per the requirements.

There are primarily 5 types of Architectural patterns.

★ Layered Pattern →

- The pattern is in layer form.
- It is most widely used pattern.
- It is most advantage for building for layers.
- It is best for real-world applications for one by one application.

★

B

Scrum Master.

- Limiting the tasks, we can manage the workload.
- Respecting the roles and responsibilities of others.
- The Kanban board is for the representation of the progress done so far.
- The work view represents the visualization of work flow.

2

D

Project Estimation.

It is important to Project Estimation.

- Task Limitation
- Work force
- Client Important Requirements
- Dead line

Without project estimation the development team can have a hard time developing the application, maybe even ending up of scrapping the project.

B

In Kanban, it is the visual representation of the progress of the work flow. It also helps to organise the process.

It mainly consists of 3 columns.

- To-do
- Doing
- Completed.

Kanban Board.

The Kanban board consists of more slots, like

- WIP Limits
