A) User Experience.

The Term 'User Experience' refers to the experience on the walkthrough journey the user will have when they interact with the web site.

Each user experience's journey is unique to the user. How they react and enjoy the website is upto their taste and desire.

B) User Interface

The Term 'User Interface' refers to the interface of which the user will first see before his or her experience with the interface.

The UI/UX designer keeps his careful thought into the design of the user interface so that it is a pleasant interaction with the user. The user interface is the home page of the website. It also that can be said in other words.

C) 2 Responsibilities of UX Designer

There are many responsibilities held account for for the

UX Designer. Here are a few.

(1) Research.

The UX designer must take his time and effort into researching into the dept of details to gather the most accurate information, and the needs to make the User Interface and user experience enjoyable for all so this research must be done.

(2) Follow up Prototype

After gathering the details and identifying a plan, he must have a prototype of it. This prototype can

fetch live user analysis data from beta testers and gathering feedback. By this constant feedback and updation we can clearly understand what the user wants.

D) Menu selection.

The menu selector is used for containing all of the website

hyperlinks in a single place. In the menu we can quickly choose

which and where to go in the website. The menu is very helpful as we can have a quick glance at what the website offers. Many UI/UX designers tend to incorporate the menu with the navbar. So if the dimension of the device is good it will be a navbar but else it will be compressed into a navbar.

E) Form Filling

A form is used to gather data from the user. Many forms can be of many types. Like example Login form, signup form, etc.

In a form there will be labels and input type boxes to get input from user. Form filling means your browser saves your data and automatically fills the data for you.

F] Radio buttons

Radio buttons are one of the many input type buttons. It

few more are Textbox, normal button etc. Radio buttons

are generally used for the user to choose one or more out of a limited set of options. They are usually round in shape. A group of radio buttons will be present and we can give our input out of these options.

A very common exam is gender selection,

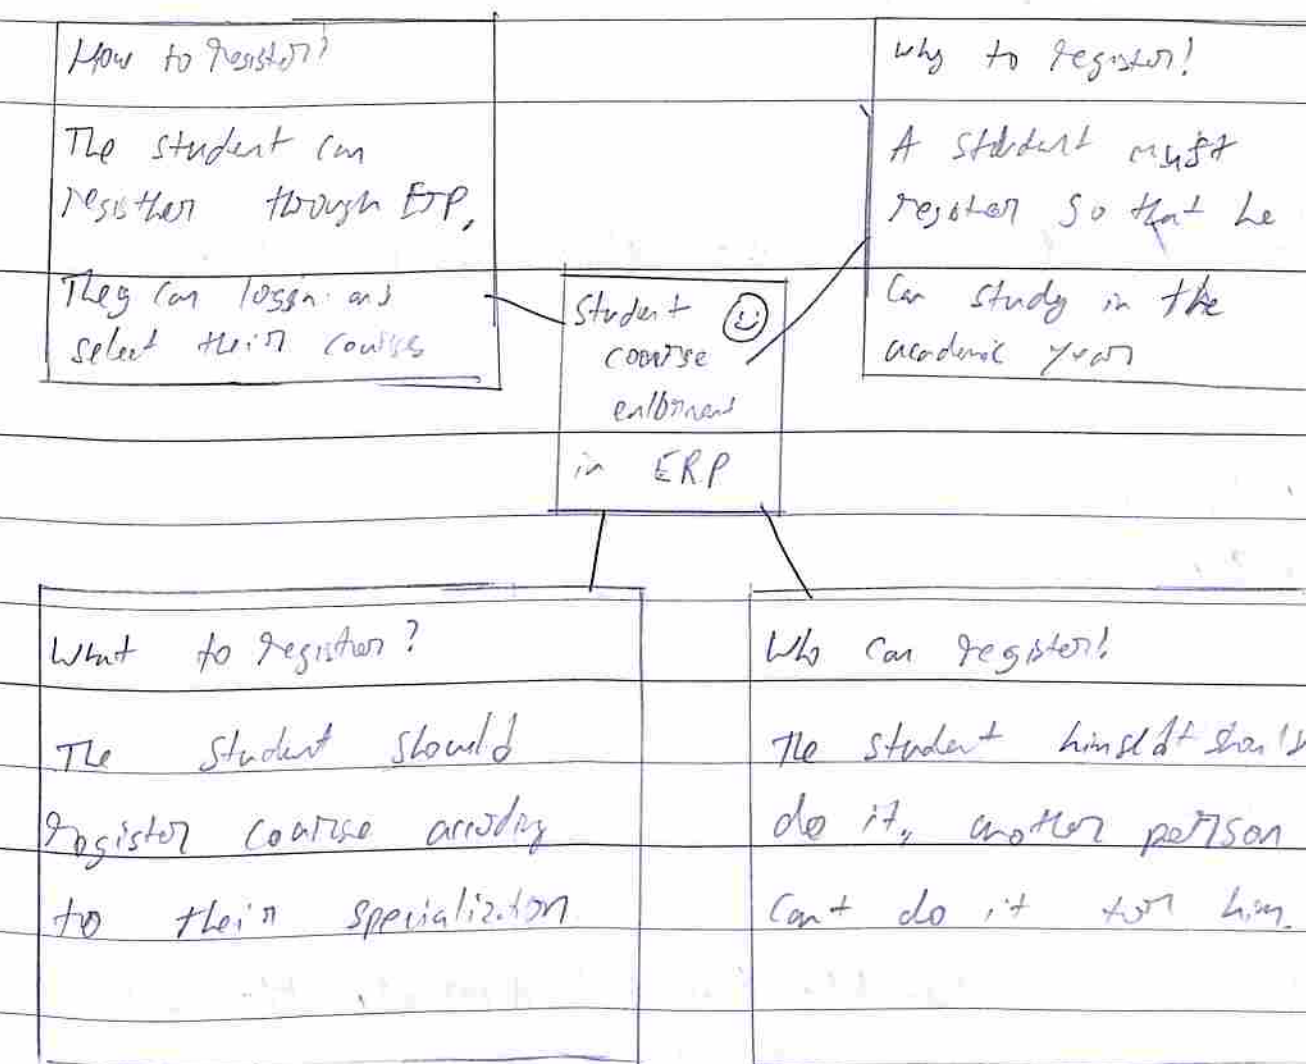

Gender: Male Female

2]

A] Empathy map, is a map trying to understand the user's experience

of a certain problem set and aims to help improve the user's experience.

Student course Enrollment in ERP

B/ Qualitative Research.

The UI/UX designer must follow mainly 5 steps

In designing

- Explore
- Define
- Design
- Prototype
- Test

For each step Qualitative Research is important. The designer should make sure each step has been done with quality and quantity to achieve perfection. Qualitative

Research is volatile in designing and without proper research, not any quality in it there is no use in designing.

C/ Customer Feedback System.

(A)	Amazon Customer Feedback	by profile
	name	
	product	
	Quality <input checked="" data-bbox="1973 808 2033 850" type="checkbox"/> <input checked="" data-bbox="2033 808 2092 850" type="checkbox"/> <input checked="" data-bbox="2092 808 2151 850" type="checkbox"/> <input checked="" data-bbox="2151 808 2211 850" type="checkbox"/> <input checked="" data-bbox="2211 808 2270 850" type="checkbox"/>	
	Describe	
	Likes and Dislikes.	

After the user has bought and received the item, AURL will be provided to direct to this page. The user can give their display name, the product will be selected by our system.

And they can rate 5 stars on their desired. After this they can give their description of their experience with the product.

1

Response time is how fast the action is being completed. Like if I place an

order how fast does it reflect in the

UI that I have placed and other.

Display Rate is how fast the website loads up. Like I can refresh and how long it takes for it to load

3

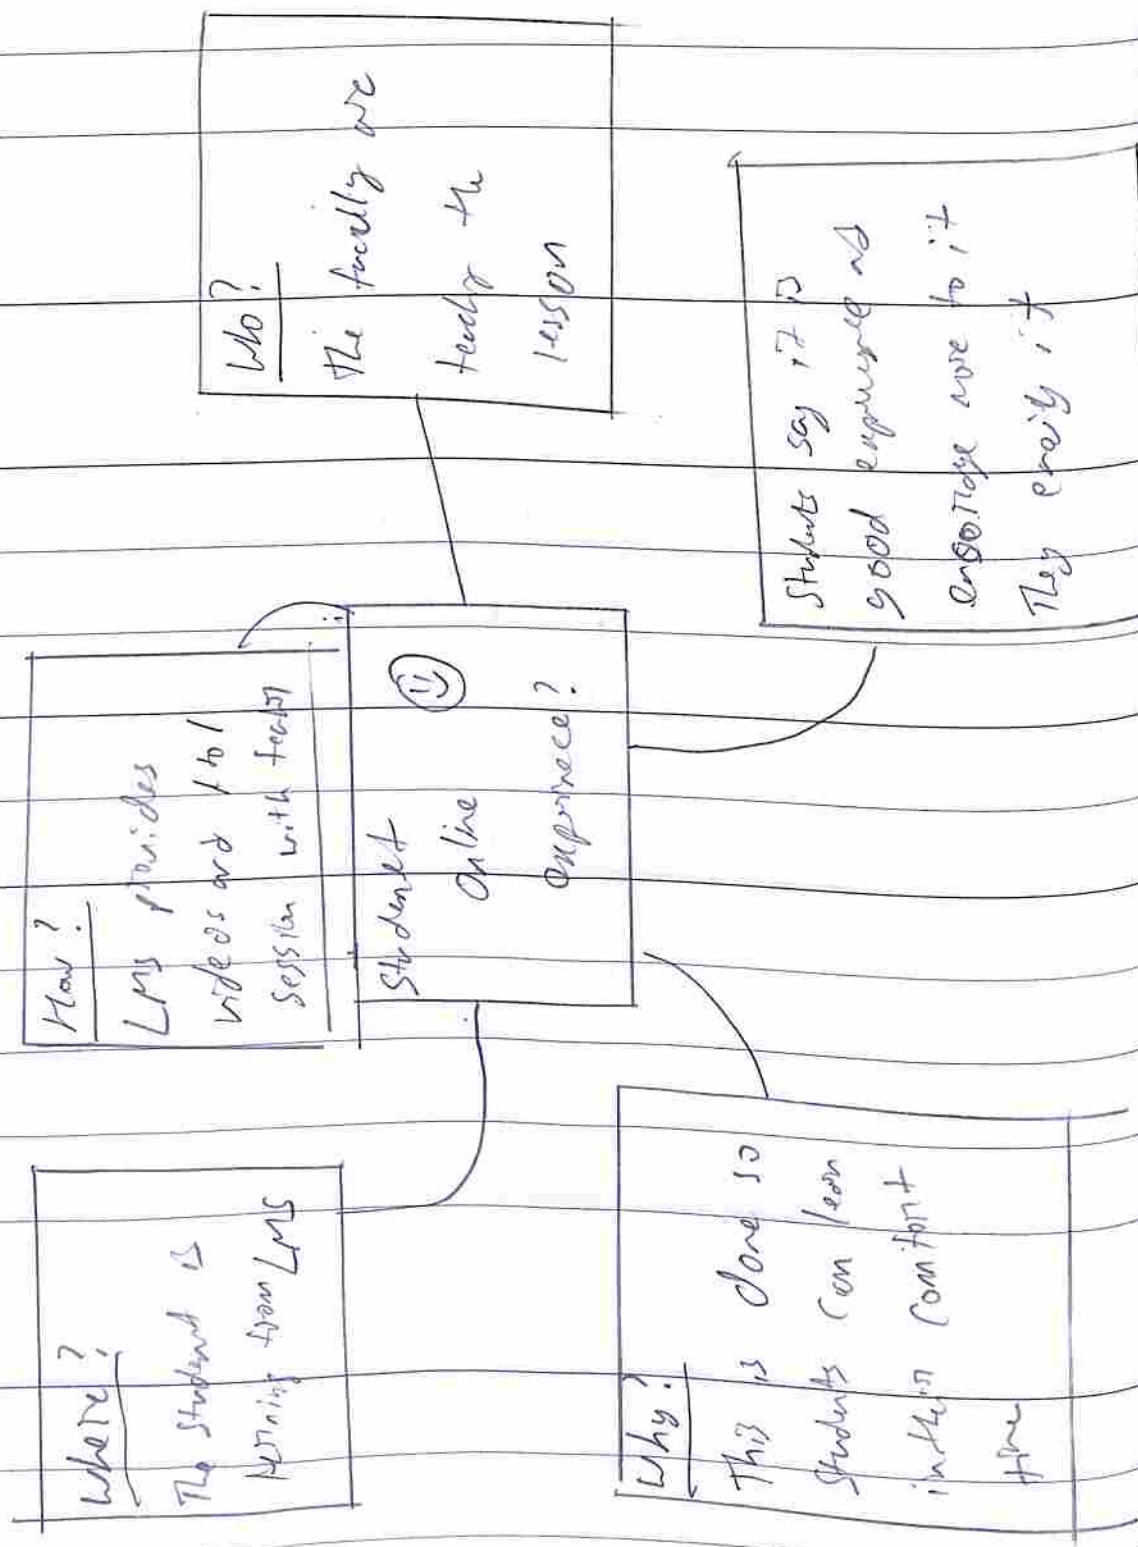

A Person is a description of the user to understand him better. A person can consist his name, strengths, weakness, hobbies etc.

Person

John Doe

	Name → John Doe. Age → 26 Sex → male
<u>Hobbies:</u> • Swimming • Music • Dance	<u>Profession</u> • Cyber security • Highest package of decode
<u>Strengths</u> • Gym • Cat	<u>Weak.</u> • Less muscle • No wife

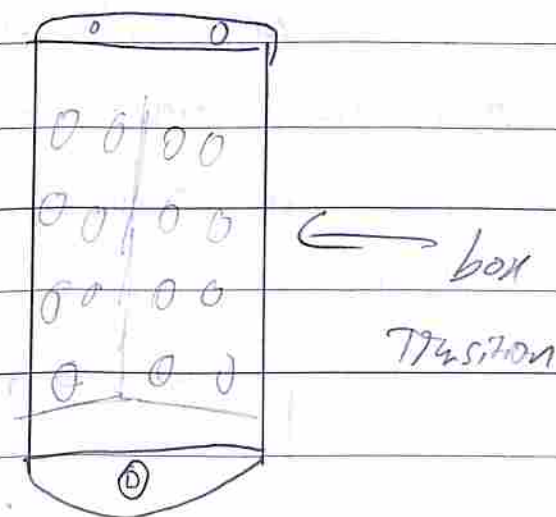

B

S

A

We can use a box transition which is optimized response and display rate. It will also be seamless.

With this transition the user will not see any lag or delay in anything.

It will be a smooth transition with optimized response and display rate.

B/

Dialoge boxes.

The dialoge boxes help very much as they give

out proper information of what we wanted to convey.
At that time we could also take user
input from the forms and get an insight
of what they are thinking, with that feedback
we can improve.
