Q.No

Q.No

1

1A

Most prevalent cybersecurity threats.

- XSS
- Privilege escalation
- Lack of RBAC
- SQL injection.
- Lack of cyber awareness.
- Admin mis configuration.
- Phishing attacks.

1B

IOT

Many IOT devices are often more vulnerable to cyber attacks than traditional computing devices. They require both hardware security and software security. Iot → Internet of things. These devices connect hardware to software and they are often more vulnerable to cyber attacks.

Q.No

TC

Strategic Security plans.

Many people have strategic security plans, but often times they may fail despite proper design. It can happen because of many reasons, Lack of communication, Knowledge Under staffed, Failing to execute the designed plan.

TD

Risk appetite.

Risk appetite is an important concept and it has a big impact on selecting security controls. Risk appetite is the understanding of the organization on assessing what security protocols are to be taken, with that in mind we can then setup the servers and the security controls

Q.No

IE]

Security maturity models.

A Security maturity model assists in evaluating the progress of an organization's security program. An organization's security program is helped being evaluated by a security maturity model. The security maturity model calculates the risks and security for an organization and then tell which to be selected.

TF]

KPI

Incident detection and Response is important as for any event to occur, the team must tend to it and make sure nothing threatens the organization. We can promote Responsibility and timely response across operational teams.

Q.No

2.

2A]

Iot & cloud computing

Iot and cloud computing are a few of the good discoveries in technology. They help and bring a big support to the tech world and for organizations using them.

But with the introduction of them we also need to update our security. Each come with it's own price. They are reshaping modern risk management practices.

With IOT we not only need to see software, we also need to update hardware security as it can be vulnerable also. So the risk management is updated.

Cloud computing can help and meet correct configurations. Any small mis configuration can lead to the down fall of the organization.

Q.No

2B/

Risk management frameworks

The application of risk management frameworks across industries is a must have for the future and security of that organization. Risk management is now being implemented in many industries like finance, healthcare and many more.

Risk management is a concept which is to be known by everyone in the organization and implemented across it. It is helpful as it is adaptable and customizable across domains depending on your requirements.

Risk management has become a necessity in all the organizations as it is adaptable and can help the organization across the board.

Q.No

2C]

Risk exposure.

Risk exposure is ~~the~~ evaluating the whole organization and
 today calculating the amount of risk which will be
 exposed.

It is important for evaluating the efficiency of a
 development team as for it's ~~in~~ ~~formation~~ ~~information~~
 can help determine the efficiency of a development
 team.

With the Risk exposure, a development team can
 understand what it's doing and work accordingly.
 With the known of risk we can be careful
 and enhance security.

Q.No

20/

Communications,

Organizations. Need to communicate with each other to help each other.

With internal communication of security risks, we can be more aware of it and enhance security.

We can keep screen meetings, or online meeting to communicate about the risks.

With the risks communicated we all know the problem and we can push together to fix it.

Q.No

3

3A

Risk management.

For an organization we need a risk management process.

- First we should check the system logs.
- Check Audit log.
- Check IPS system.
- Check Roles access.
- Check Access controls.
- Check time stamps.
- Check leak protocol.
- Check internship opportunities.
- Check Admin access.

With Risk Management process, we can ensure an organization is secure.

Q.No

3B]

Gap analysis.

Gap analysis is the analysis of the gap between the finished goal project and the current state of the project.

With the gap analysis data, we can tell which is where going how to when. With that in mind we can communicate with the organization to see how the development team can be improved.

And with the analysis we can actively check for bugs and add security protocols as per accordingly.

Q.No

6

6A

Risk appetite and tolerance

Risk tolerance is the amount of risk the org willing to take for with the projects.

Risk appetite is the amount of risk to be taken for the project.

With Risk appetite and tolerance, we can help design a strategy that aligns an organization's security posture with acceptable risk levels.

With all in mind we can communicate across the organization for all security to be implemented.

Q.No

6B/

Incident Management and response metrics.

It is the responsibility of all the management team to be responsible and give timely response across operational teams.

For any incident to occur, we have a set of protocol to follow to ensure the incident is not a big problem for the organization.

We can promote Responsibility and timely response across Operational teams.

- Check Audit log
- Check IDS system
- Check Roles access
- Check access control.
- Check time stamps
- Check login protocol.
- Check admin access
